## **DETAILED ACTION**

### ***Drawings***

The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the inverting input of the second gm cell connected to the inverting input of the first gm cell must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

### ***Specification***

The specification is objected to as failing to provide proper antecedent basis for the claimed subject matter. See 37 CFR 1.75(d)(1) and MPEP § 608.01(o). Correction of the following is required: Claims 18, 26 and 32 recites the limitation "variable resistance". There is insufficient antecedent basis for this terminology in the specification.

### ***Claim Rejections - 35 USC § 112***

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 18-37 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter, which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed

invention. The neither the specification, drawing or original claims disclose the nonlinear resistance shown in figure 5 being a (or plurality) native MOS device. In the specification, applicant discloses that the transconductance cell shown in figures 4 and 9 comprises of a transistor device 60 which function as load resistors for current sources 62 and 64. Applicant further disclosed that the transistor devices are native MOS devices. Applicant's specification is silent with regards to the non-linear resistor connected between the noninverting and inverting output of the first gm cell, which is disclosed in the independent claims. Therefore, reciting that that the non-linear resistor is a native MOS device constitutes new matter since neither the specification, drawing or original claims disclose such a limitation.
